Hierarchical ZnIn<sub>2</sub>S<sub>4</sub>/β-NiO  
Nanoarchitectures: Synergistic Effects  
on the Supercapacitor Performance. It is  
of great importance to fabricate  
hierarchical nanostructures for  
assembling the efficient energy storage  
systems. In this work, hierarchical zn-  
indium sulfides (ZnIn<sub>2</sub>S<sub>4</sub>) and β-NiO  
nanostructures were prepared via two  
facile approaches, including a thermal

---

annealing process and a co-precipitation route. The unique hierarchical architectures with a shell-core structure were achieved, in which the  $\beta$ -NiO nanorods with a length of tens of micrometers were wrapped by the nanoparticles with an average size of about 2 nm. The underlying mechanism is demonstrated, which is benefited from two aspects: i) the small primary ZnIn<sub>2</sub>S<sub>4</sub> nanoparticles with a cubic morphology could trap the polysulfide species and prevent the polysulfide

---

agglomeration; ii) the nanorods with a higher specific area could provide better contact interfaces, which effectively suppress the diffusion of polysulfide. Benefiting from the hierarchical structure, excellent electrochemical behaviors were obtained with good cycling stability. The synergy is the combination of two components and the results show that the current work may provide a new approach for developing more effective energy storage systems. Jackfruit (jackfruit, ornaments)

---

on the tree or in the center is a small and popular decorative fruit in the tropical countries. They have a delicious taste with "Bengal (India)" origin. The Jackfruit is the largest of fruits in the culinary size. The outer surface of fruit is very soft and there are many small holes. As a tree, it grows about ten meters high with branches. The size of the fruit is about half the diameter of the apple. The fruit is covered with white to beige colored skin. The fruit is planted in spring and harvested in autumn. We

---

can taste the sweetness of the fruit in December. The Jackfruit has a cup-shaped cavity which is filled with small bubbles (bungers). It is a well known that, when light is reflected on a metal, a metal surface is displayed as a bright point and a part of the reflected light passes through the metal surface. This
