----- The library was built to allow easy access to Object Databases. All of the classes you will see below are template-based. You don't need to know how to use templates. You just have to declare the types and constructors of the templates, and the template library will do all of the rest. The basic classes are as follows: \* database-handle : a simple wrapper around the underlying library. \* table-handle : a wrapper around one or more tables in a database. Tables can be queried, inserted, upgraded and deleted. \* index-handle : a wrapper around an index in a table. It can be queried, upgraded, and deleted. \* sequence-handle : a wrapper around a sequence in a table. It can be queried, upgraded, and deleted. \* schema-handle : a collection of all the tables and indexes in a database. \* query : a collection of filters and ordering conditions and a builder to specify a SQL query. ----- LiteSQL Product Key is a reliable C++ library designed to integrate C++ objects into relational databases and thus to provide an object persistence layer. LiteSQL supports SQLite3, PostgreSQL and MySQL as backends.

LiteSQL creates tables, indexes and sequences to database and upgrades schema when needed. In addition to object persistence, LiteSQL provides object relations which can be used to model basic OO building blocks (aggregation, composition, association). Objects

can be selected, filtered and ordered using template- and class-based API with type checking at compile time. LiteSQL is a reliable C++ library designed to integrate C++
