Layers Layers are a Photoshop concept that's essential for image editing. The main components of a layer are Selection: An area, shape, or pixel or image that you want to modify. Masking: The process of hiding information you don't want to change. Transparency: The setting of how much of one object or layer you see through another. Layer mask: The tool that brings transparency to the foreground or background of a layer. Figure 2-2 illustrates the basics of layers and how they work. **Figure 2-2:** Layers are a staple for editing images. Layers are used to create raster images. When you look at an image as a raster, you can create a new layer to edit the image, or you can create a mask to limit an area of an existing layer to be edited. There are a few techniques to create or manipulate layers; the most common ways are the following: Click Layer from the top menu and select New. This brings up a layer window that asks for an object to apply the layer to. Layers can be applied to multiple objects, so you simply select the object or objects you want to modify. Click Layer (or choose from the Layers drop-down menu) and select the object you want to modify. This saves you the trouble of changing the object in the main image window. From the Layers drop-down menu, choose Layer via Copy. Choose Layer via Paste to return to the previous method. TIP As you work with layers, it is sometimes helpful to use the View menu to change the Layers panel to see all your layers at once. You can change the viewing options using the View menu. Before going too far, don't forget that there are different ways to modify layers than there are on the Layers panel. The next four sections describe four ways to edit layers. Brush You can use the Brush tool to modify either a foreground or background layer. You

Q: Creating database for iOS I want to create database for my iOS app. Do i need database service (like MySQL, Postgres, MongoDB) or can i create database in my app and use SQLite? Is there any other method for creating db? A: It is recommend to use Realm for iOS. A: You should try Realm. It is similar to SQLite, but you can sync data between devices/ simulators. Realm is also already included in the iOS SDK since version 6.0. You only need to add the supporting code: Add: #import Create: RLMRealm *realm = [RLMRealm defaultRealm]; Use: NSArray *realmResults = [realm objectsWhere:@"status = 1"]; // If you want to create objects programmatically: realm.addObject(@{@"name":@"john", @"lastName":@"smith"}, nil); // If you want to update existing objects: realm.addObject(@{@"name":@"z", @"lastName":@"smith" }, nil); // If you want to delete objects: realm.deleteObjects([realmResults objectAtIndex:0]); // See the full documentation here : Be aware that Realm.io is not free. For a limited number of free users they will give you a free developer license when you register here.
