controllable pore size and show catalytic activity in Suzuki-Miyaura reactions. A facile method for the preparation of monodispersed Pd nanocages with a high surface area and controllable pore sizes is reported. A mixture of polyol and Pd precursors formed a syrup which was heated at 100-120 °C, resulting in the formation of single-crystal Pd nanocages with well-defined size and shape. The position of precursors relative to solvents is critical for the formation of nanocages. Pd nanocages were well-distributed and uniformly dispersed among mesoporous SBA-15 with the average pore diameter ranged from 3.5 to 5.5 nm, and thus the BET surface area is about 780 m²/g. The specific surface area of Pd nanocages (as determined from N₂ sorption isotherms) is about 204 m²/g, which is much higher than that of as

Evaluation of the safety and efficacy of iodixanol in patients undergoing percutaneous coronary interventions. To examine the safety and efficacy of the nonionic, osmotic, macrocyclic contrast agent iodixanol in patients undergoing percutaneous coronary interventions. One hundred and eight patients were enrolled in an open-label study comparing treatment with iodixanol, a new nonionic, osmotic, macrocyclic contrast agent, with a conventional nonionic, isoosmotic, monomeric contrast agent, iopamidol. The study consisted of two identical protocols, each comparing iodixanol with iopamidol in the context of a routine percutaneous coronary intervention procedure (with and without aspiration of contrast into a central venous system). During the procedure, perfusion variables, including global left ventricular function and regional wall motion, were continuously monitored. No serious adverse events were associated with the use of iodixanol. The incidence of clinically important adverse effects, as defined by the clinical symptoms of angina, left ventricular failure, or new-onset myocardial infarction, was similar in patients receiving iodixanol and those receiving iopamidol. In the context of percutaneous coronary interventions, iodixanol, a new, nonionic, osmotic, macrocyclic contrast agent, compares favorably to a conventional monomeric contrast agent.Q: Detecting voltage from an LED circuit I'm relatively new to electronics, and I've been making some circuit projects to extend my knowledge, and this one is an LED light whose brightness is controlled by an Arduino. However, when I connect the circuit, the Arduino does nothing, so I'm guessing I'm supplying the circuit with too little voltage. I have a 5V Arduino +5V Arduino-compatible power adapter, and I use alligator clips to connect the LED and ground, after making
